

Example: YouTube

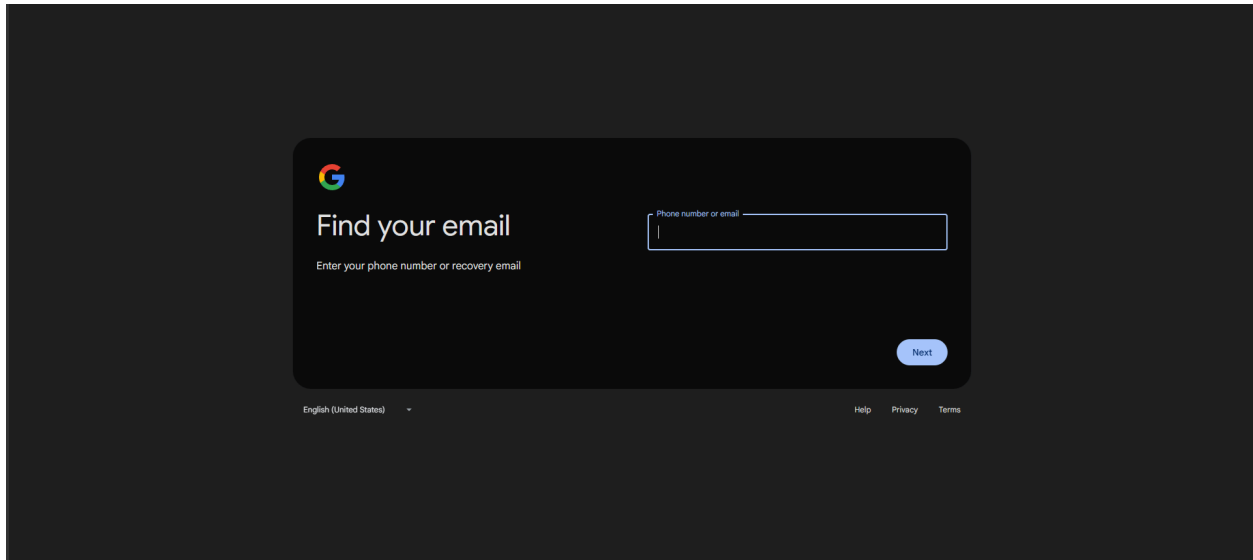

Example: YouTube

We probably won't want all of this information in the final submission, but I'm going to just put all my notes here and we can delete anything we're not using. This process might be a bit overkill and/or require too heavy of changes from the given information to follow, but maybe there's something useful here. - Alan

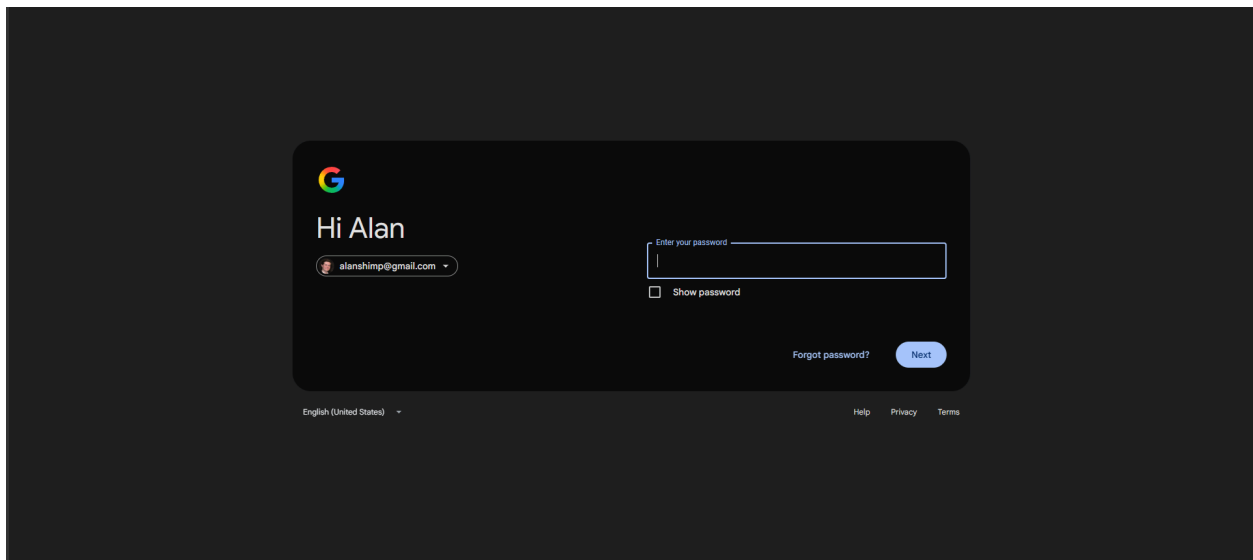

The initial sign-in page includes only an input for the email. One can also sign in by phone number. There's no distinct username entry in this signin process, but we can consider this analogous. Aside from the more service-specific "guest mode" and simply entering the email and moving to the next screen, there are also options here for if the user forgot their email or to create a new account.

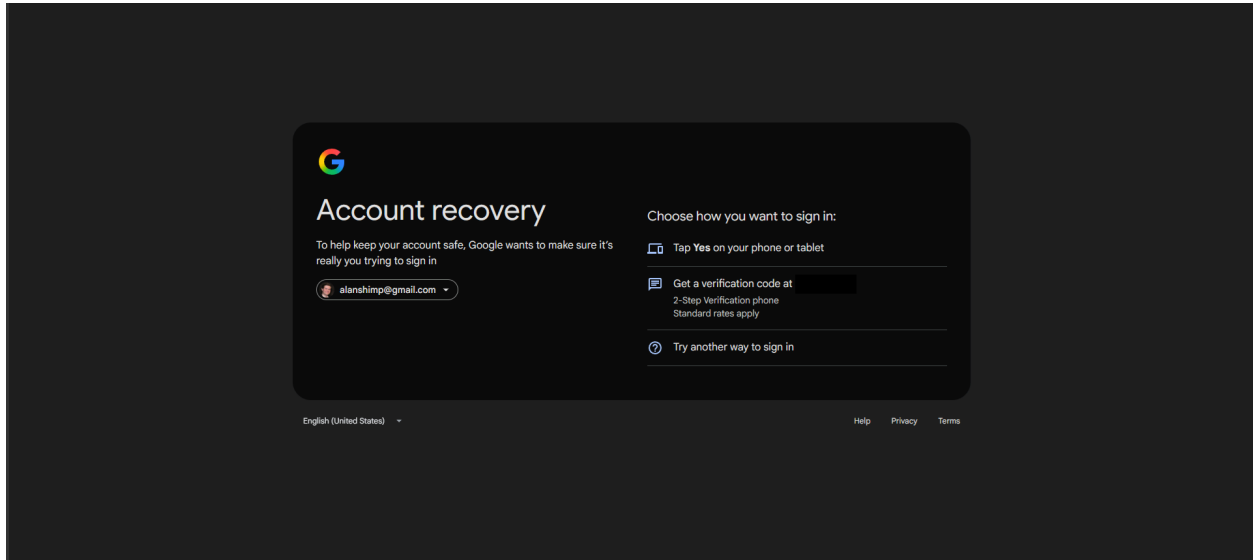

This is very simple; it presents the user with the bare minimum of initial options to avoid flooding them with information.

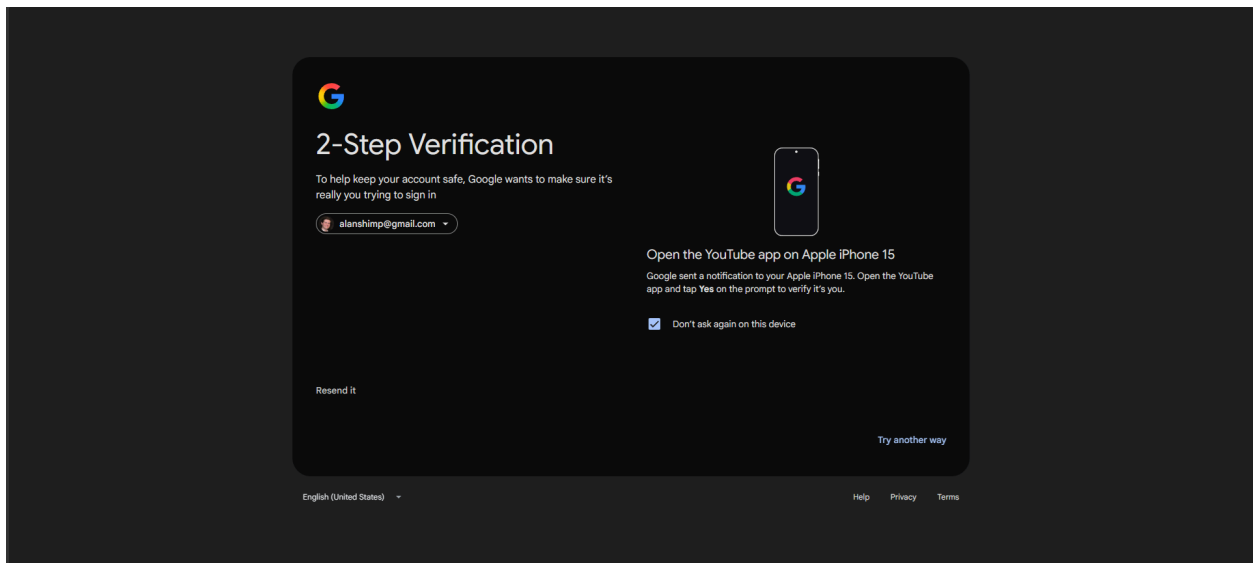

The “forgot email” page is odd; it asks for a phone number or email, the exact same information the user would use to sign in. The smaller text on the left mentions that they’re asking for a *recovery* email (i.e. a different address from the one directly associated with the account), but the heading and entry field omit that clarification.

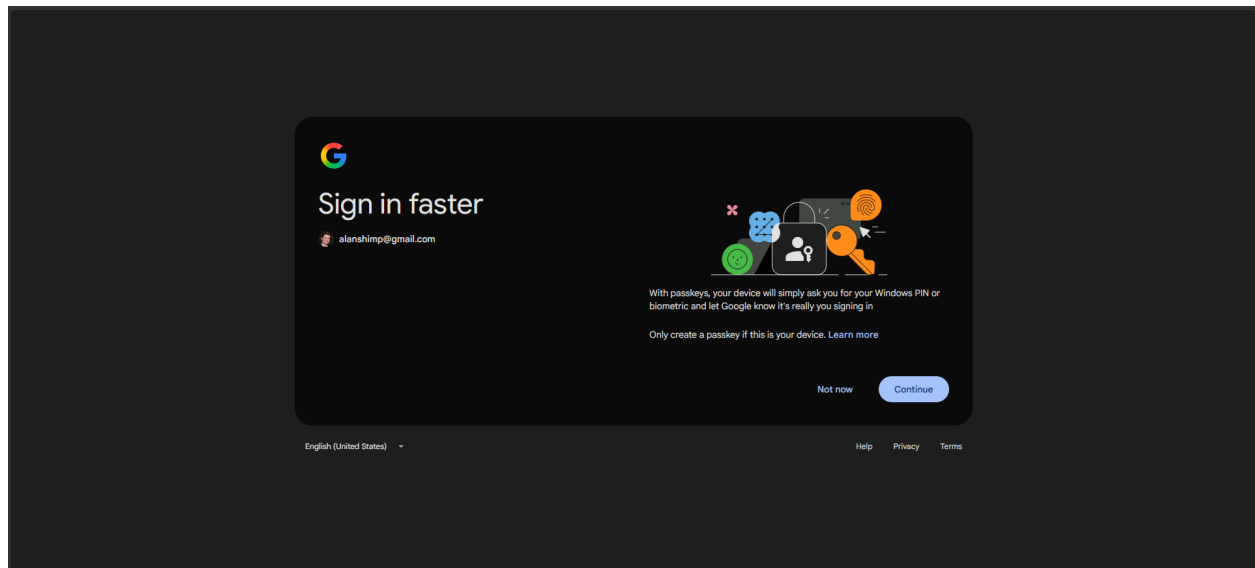

If an appropriate email is entered, the user arrives at the password page. It greets the user by name and email, confirming that the email has been recognized. It doesn’t seem entirely necessary to have multiple steps here, but confirming the username before the password is entered does clarify at which step an error is being made. The password can also be hidden or shown at the user’s discretion, defaulting to hidden. Especially when passwords need to be long and complicated, it can be helpful to be able to check that they’ve been entered correctly. There are buttons for forgotten passwords and to move to the next screen.

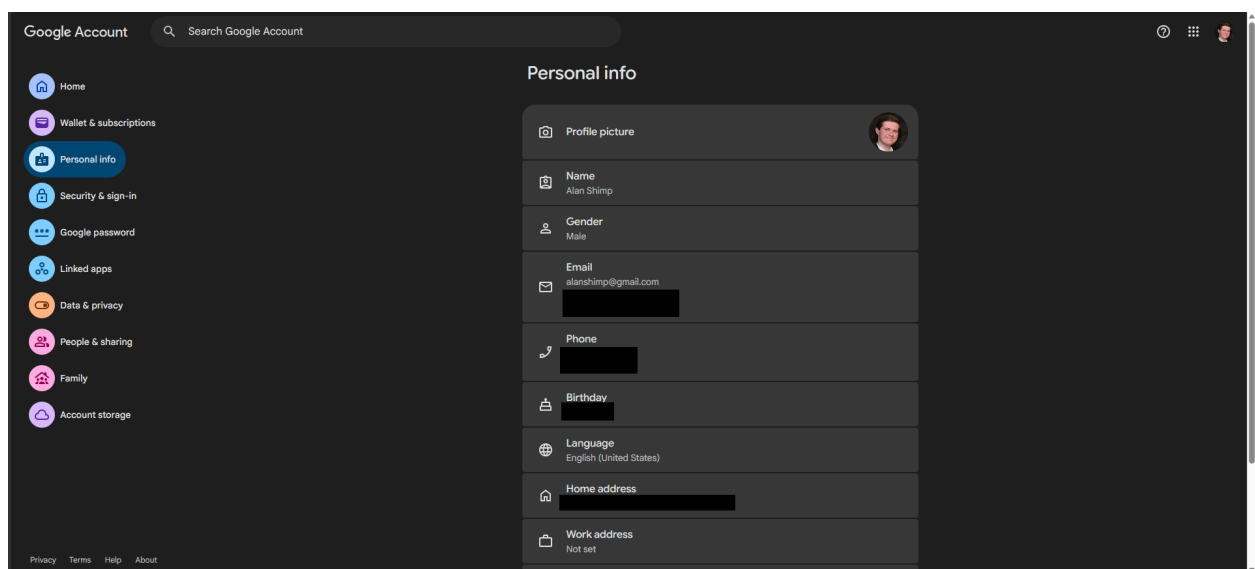

Account recovery supports password recovery via a second device or a text message. It's unclear if this would be feasible for this project.

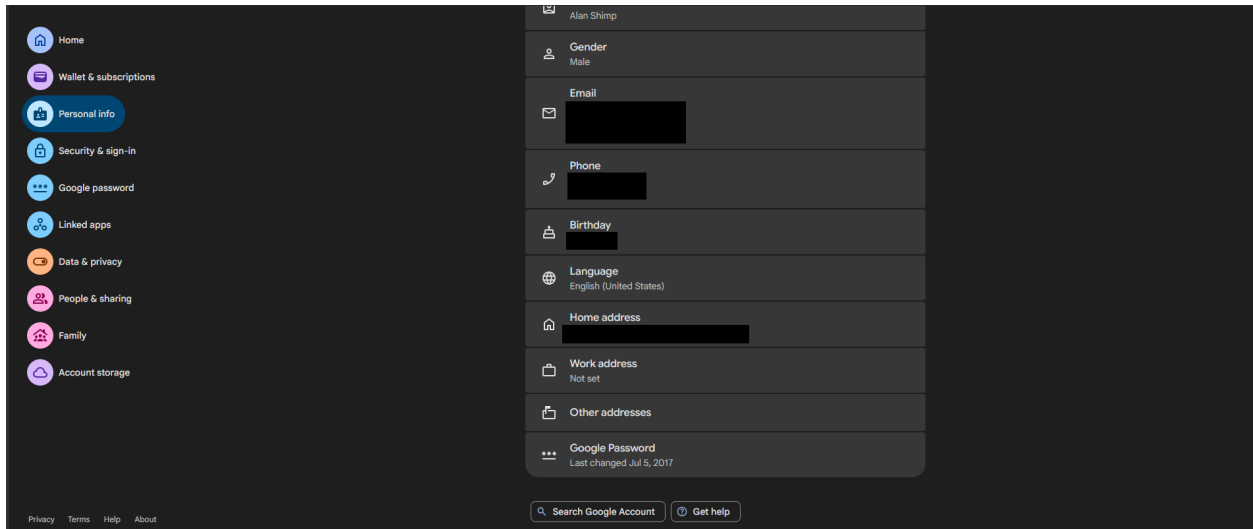

This platform requires two-step verification using a related app. That is unlikely to apply to this project.

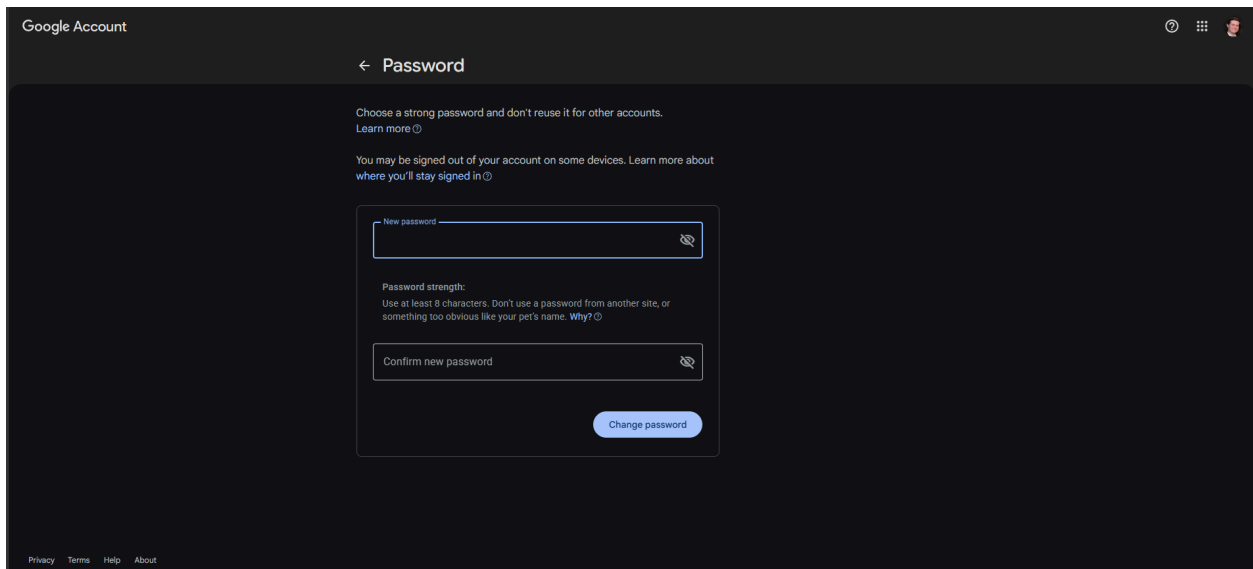

Upon signing in, there's an option to create a passkey based on the computer's sign-in methods like a PIN or biometric. This is getting to be a *lot* of screens just to sign in; it might be better to minimize that.

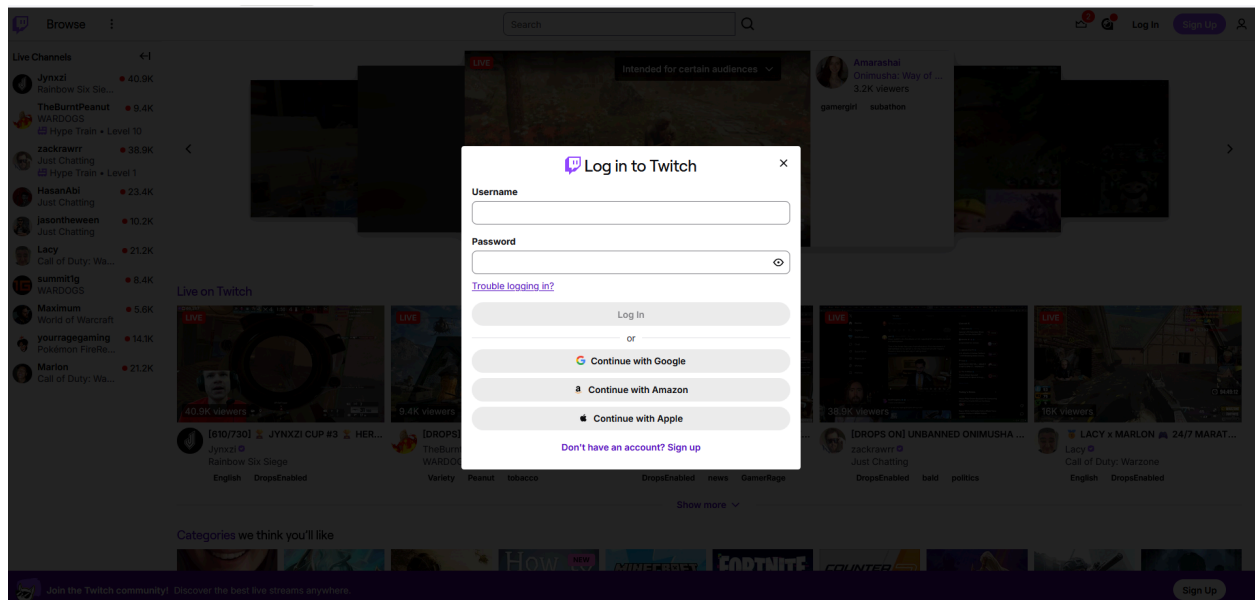

To change account information, the user is redirected to the general Google account screen. Each field can be selected to add or change the information it contains. If you haven't signed in recently, these individual pages require an additional signin to access. While it presents more information, this page is consistent with the design so far: A large number of individually visually simple pages, with steps of any given process highly separated onto their own screens. Any given stage of it is visually appealing and confirms that prior steps have been executed properly, but it is tiring to have to go through screen after screen just to log in or change one piece of information.

Clicking on password, for example, takes you to a page to change your password. This requires a second entry to confirm like on account creation, which is good for consistency.

Example: Twitch.tv

Example: [Twitch.tv](https://www.twitch.tv)

They have a simple username and password log in fields, I tested both and neither seem to have a limit on the amount of characters that can be input before validation. The forget your password function is there as well as the link “**Trouble logging in?**”, which I do believe is a important function we should implement. - Alex

Getting back into your Twitch account

For passwords the requirements are as follows:

Passwords must be at least 8 characters long

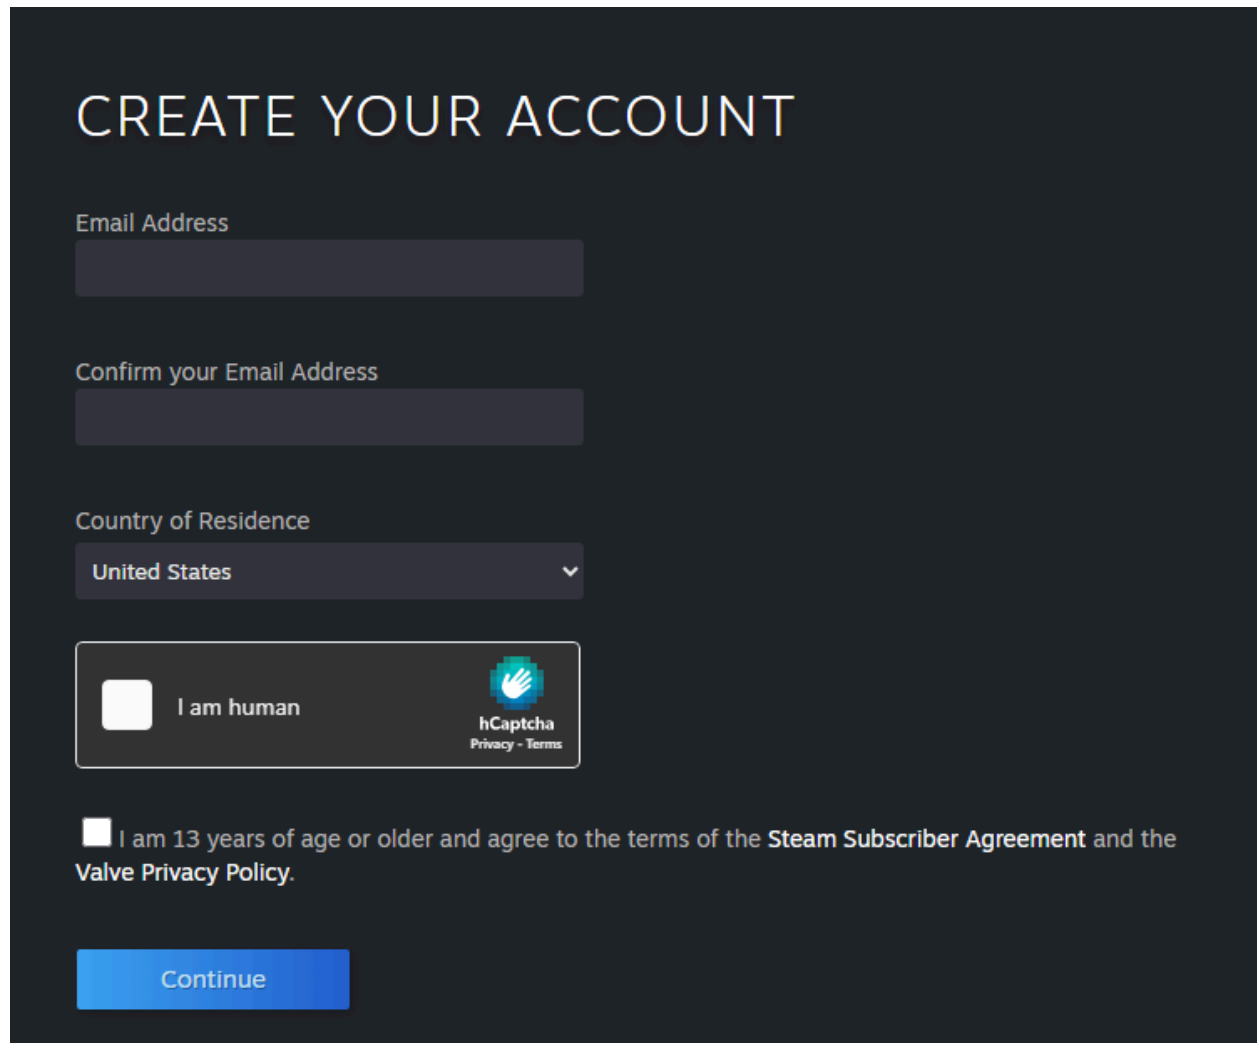

Your new password must be a password you have not used before (Means they're keeping your old ones somewhere)

Passwords must be shorter than 72 characters.

Example: Steam

Example: [Steam](#)

Steam is a widely used gaming platform with millions of users. Steam is well known for their great customer service and account security. I think taking notes from their account creation would be a good idea for creating our own. -Caleb

The image is a screenshot of the Steam account creation page. It has a dark blue background. At the top, the text "CREATE YOUR ACCOUNT" is displayed in a large, white, sans-serif font. Below this, there are three input fields: "Email Address", "Confirm your Email Address", and "Country of Residence". The "Country of Residence" field is a dropdown menu currently showing "United States". Below these fields is a hCaptcha widget with a blue square icon and the text "I am human". To the right of the hCaptcha icon is the hCaptcha logo and the text "hCaptcha Privacy - Terms". Below the hCaptcha widget is a checkbox with the text "I am 13 years of age or older and agree to the terms of the Steam Subscriber Agreement and the Valve Privacy Policy." At the bottom of the form is a blue button with the text "Continue" in white.

Steam requires the user to begin by putting in an email address and confirming it.

Verify Your Email

Check csbeaven@asu.edu for an email from Steam to complete your account setup.

Waiting for you to verify...

Haven't gotten our email?

Expand ▼

After you enter your email it waits for you to confirm it.

To continue creating your new Steam account, please verify your email address below.

VERIFY MY EMAIL ADDRESS

Steam requires a verified email address so you can take full advantage of Steam features like Steam Guard security, the Steam Community Market, Steam Trading - and so you can safely recover your account in the future.

Manage Email Preferences

Valve may also occasionally send you emails to inform you about games and events on Steam. If you do not wish to receive such messages or you wish to manage when you will be contacted, you can set your email preferences [here](#) once your account is created.

If you didn't recently attempt to create a new account with this email address, you can safely disregard this email.

The email explains why the user's email is needed to create the account.

CREATE YOUR ACCOUNT

Steam Account Name

Choose Password

Confirm Password

After verifying via the email the user can proceed to making the account, providing an account name field and two password fields.

Steam Account Name

Calebs&ASU03

✓ Available

Choose Password

•

Password must contain at least 8 characters

Confirm Password

Done

The first screenshot shows a 'Choose Password' field with a hint: 'Include lowercase and uppercase letters, numbers and symbols for a stronger password'. The second screenshot shows another 'Choose Password' field with a hint: 'Choose a less commonly used password'. The third screenshot shows an account name field with a validation message: 'Please enter an account name that is at least 3 characters long and uses only a-z, A-Z, 0-9 or _ characters.'

The Account name field will tell the user if the name entered is available, the amount of characters that can be entered in this field as 59 before it simply doesn't allow you to type anymore in. If you enter a name with invalid characters a message popup will tell you what is required for a username.

The first password field can only take 59 characters just like the username field. Steam will give messages to help you create a valid password, such as specifications on the characters suggested and if the password is too common.

The second Confirm Password field simply needs the first password entered to be repeated, otherwise it will tell you the passwords do not match, and not let you proceed.

The screenshot shows the 'Steam Support' page with the title 'How would you like to change your email address?'. Below the title are two options: 'Email an account verification code to c*****@a**.e**' and 'I no longer have access to this email address or did not receive a code'. Both options have a right arrow icon.

Once you create your account you can go to a security page where you can change your username or password. After selecting to change either, you will be able to send a verification code via email to do so, or if you do not have access to the required email you are sent to a new

page.

Let's help you fix this issue!

Before we can make security changes to your account, we need to make sure you're the real owner. You can make this go faster by providing as much information below as you can.

Example: GitHub

User Experience and Interface

GitHub

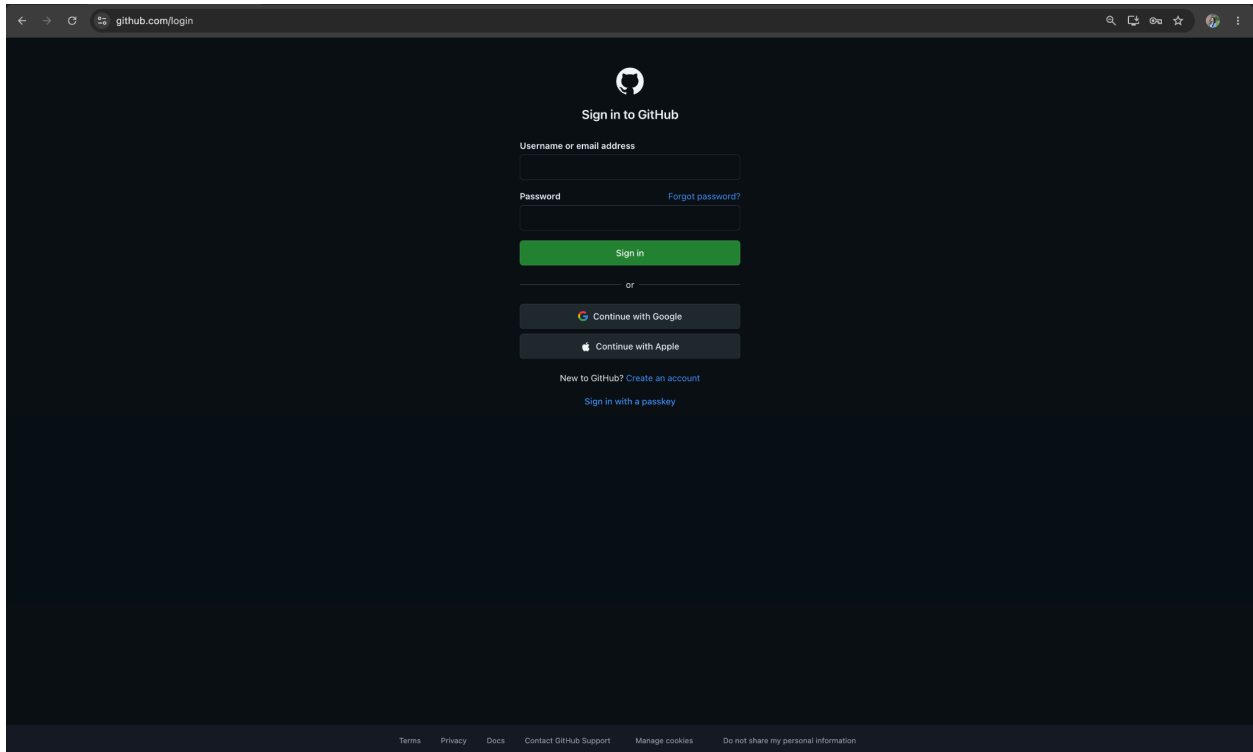

Venus Ho

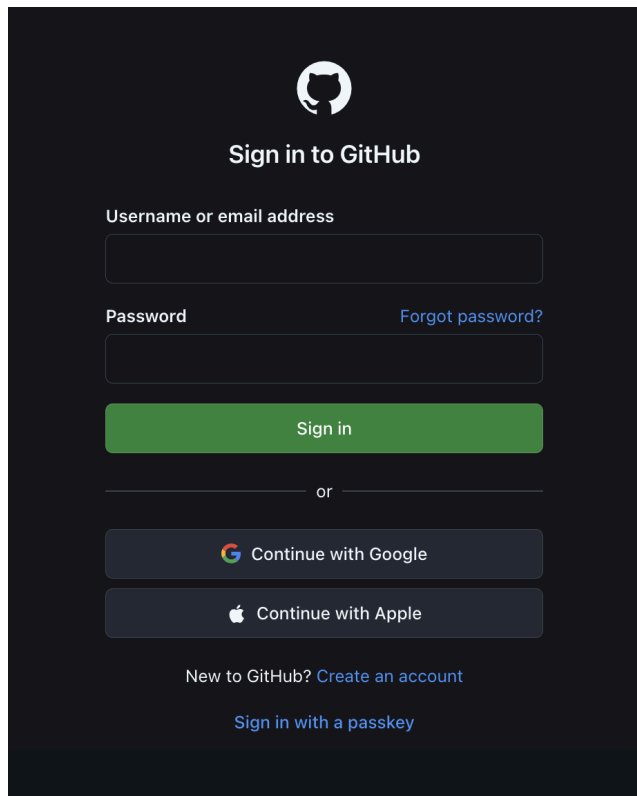

GitHub Home Page

Sign In / Sign Up buttons at the top right corner of the page

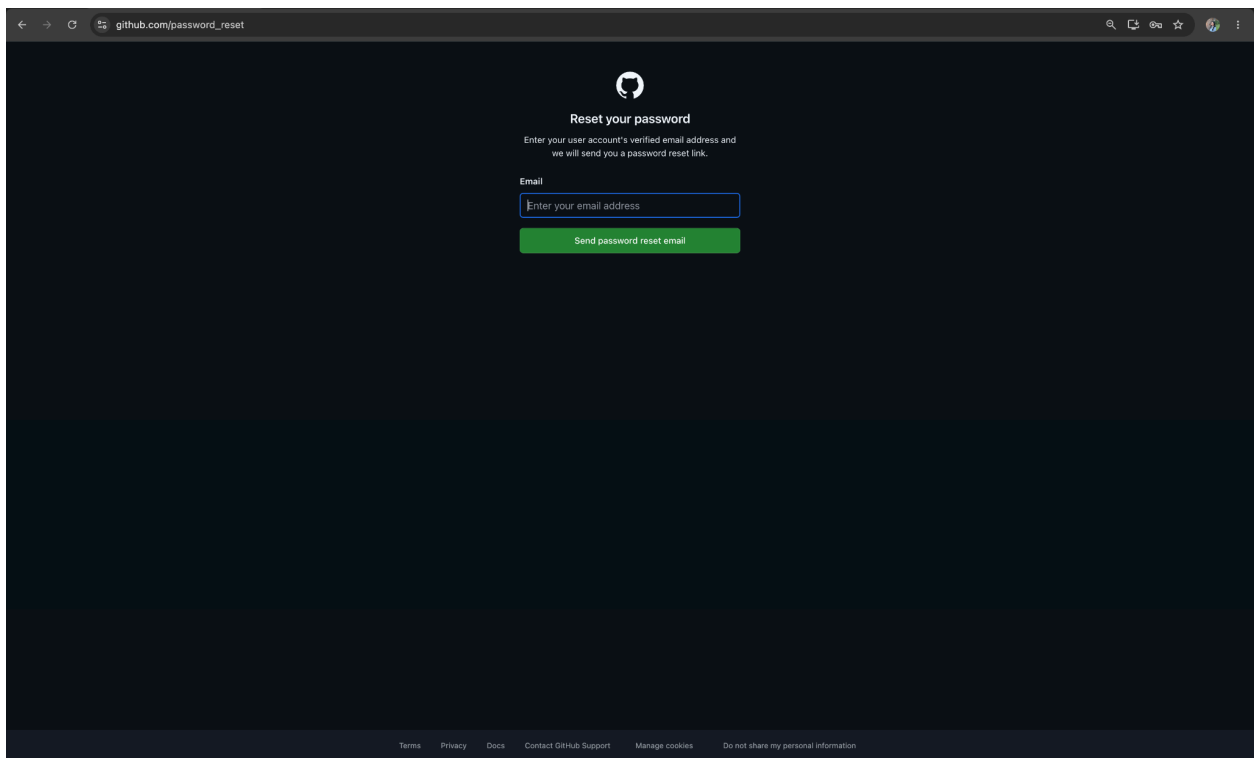

Sign In page

Sign In Page - close up

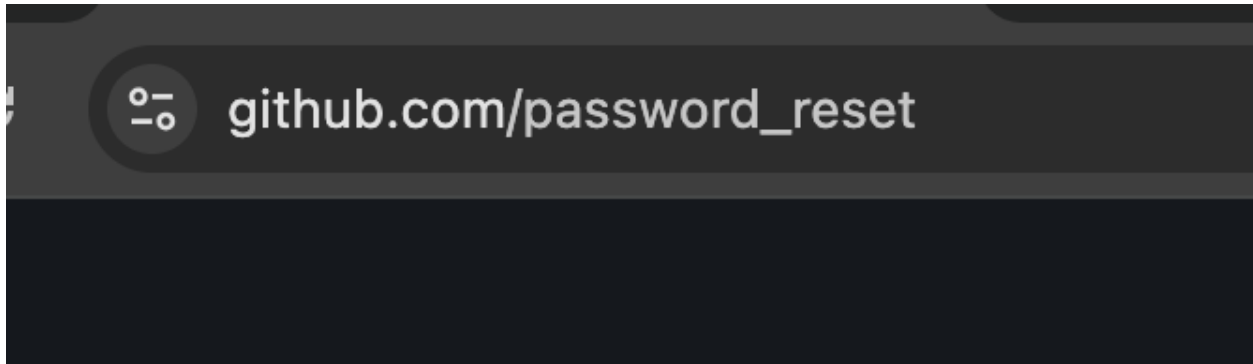

GitHub's sign-in page has a very clean and focused design. The login form is centered on the page, which immediately draws attention to the username/email and password fields without adding unnecessary distractions.

- The primary **Sign in** button is easy to identify, while other options such as signing in with Google or Apple are placed underneath in a clear order.
- The page also includes helpful links like **Forgot password?**
- **Create an account** without making the interface feel crowded, which keeps the overall experience simple and easy to navigate.

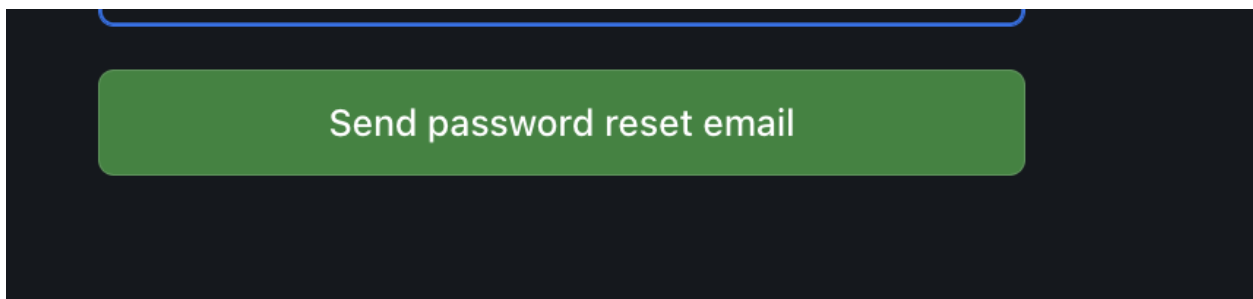

Forgot Password page

The forgot password page keeps the same clean and simple layout as the sign-in screen, making the process easy to understand. It only asks for the necessary information and clearly explains what will happen after the email is submitted.

Forgot Password page URL

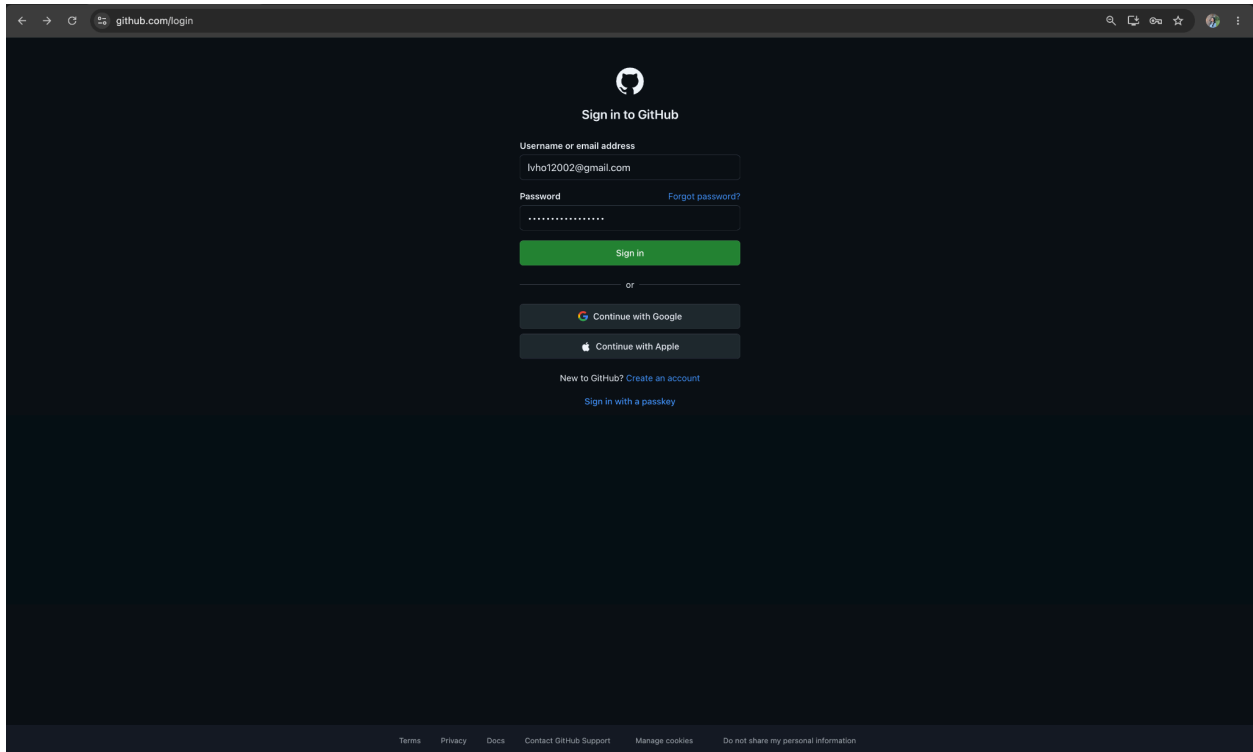

The URL is short and descriptive, making it easy to understand what page the user is currently on. Using a simple path like **/password_reset** is much cleaner than displaying a long or confusing string of parameters.

The bright green button stands out immediately against the dark background, making the main action easy to find. Its large size and clear label also make it obvious what will happen when the user clicks it.

NOTE: It's also green in light mode.

The green button color works well in both light and dark mode, so the primary action stays easy to notice without feeling too harsh. Using the same accent color across both themes also helps keep the interface consistent and comfortable to look at.

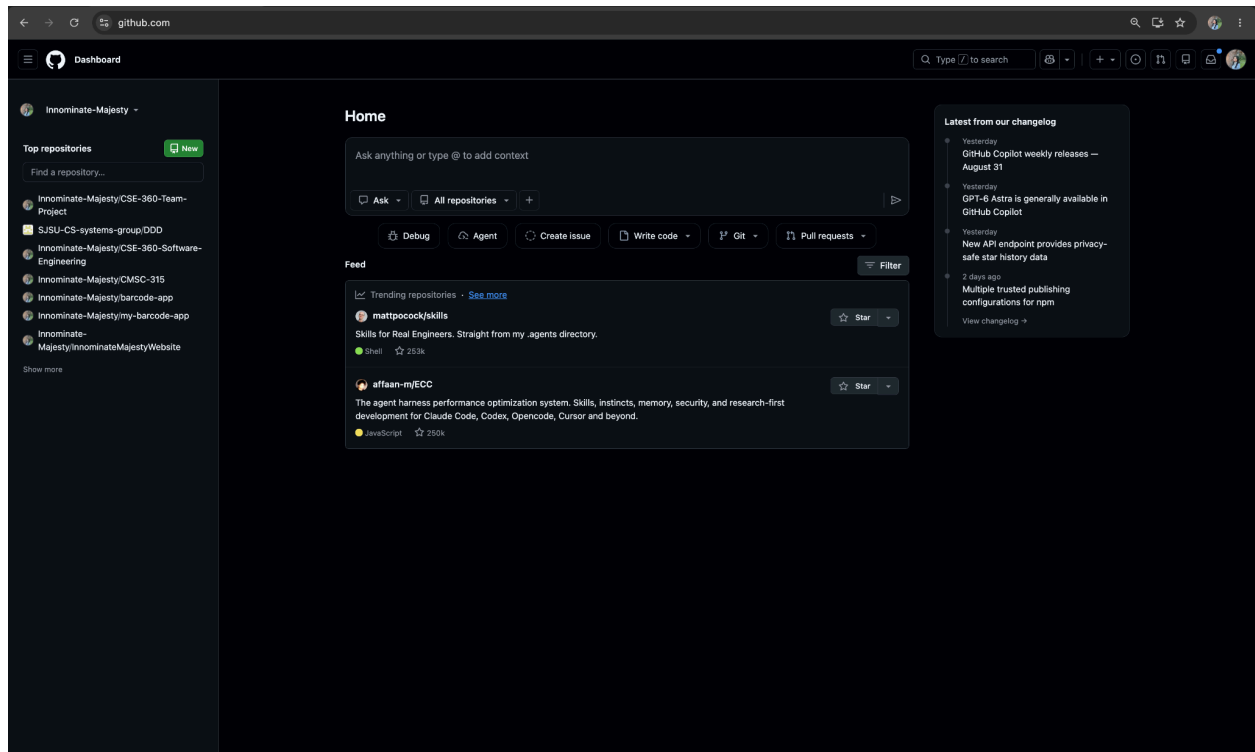

Sign In page with Login Infos

The password is masked as it is typed, which helps prevent someone nearby from easily seeing the user's password on the screen. GitHub also does not provide a visible "eye" icon on this page to reveal the password, keeping the field consistently hidden while entering it.

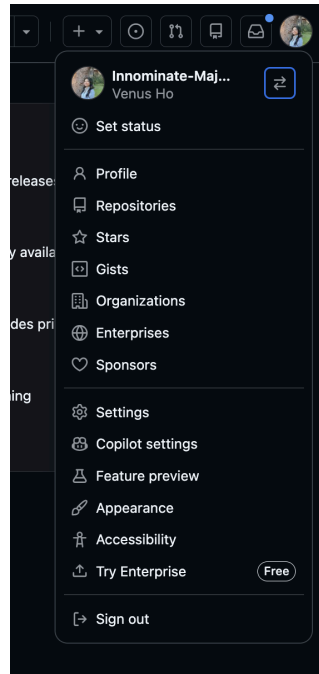

NOTE: Sign In button is also green, just like the one in Forgot Password.

GitHub gives users several ways to sign in, including a traditional email/username and password, Google, and Apple. Offering multiple sign-in options makes account access more convenient and can also make the account creation process feel quicker and easier for new users.

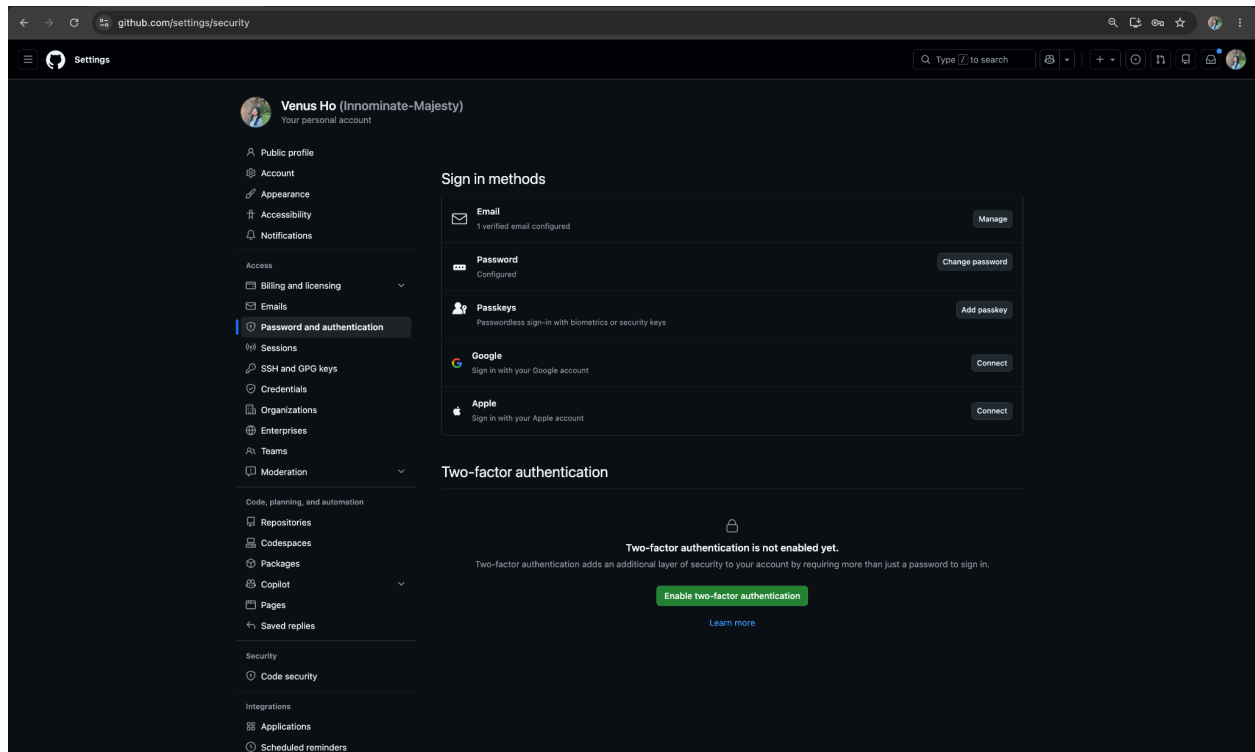

Home Page/Dashboard page

After signing in, GitHub brings the user directly to the main dashboard, where repositories, recent activity, and common actions are immediately available. This makes the transition from login to the main workspace feel natural and gives the user quick access to the features they are most likely to use.

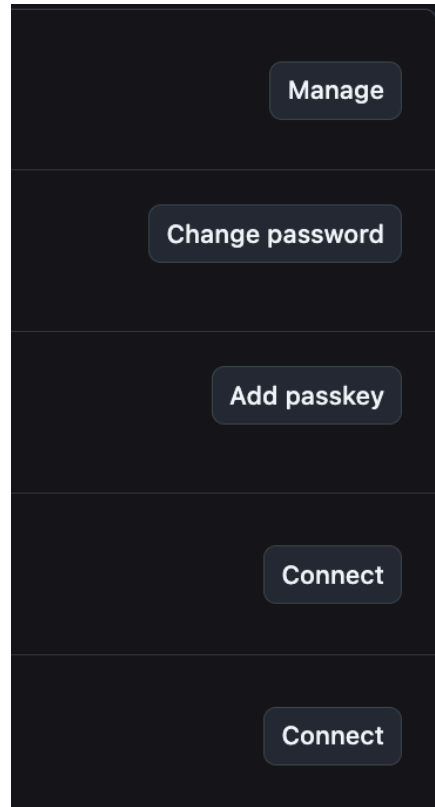

Profile/Settings Side Bar

On any GitHub page, clicking the profile picture opens a menu with quick access to account-related options such as the profile, repositories, settings, appearance, and accessibility. From this menu, the user can also sign out or quickly switch to another account, which keeps common account actions easy to reach from anywhere on the site.

Settings → Password and authentication page

This page organizes GitHub’s sign-in and security settings in one place, making it easy to see which login methods are connected to the account. It also separates options like email, password, passkeys, Google, Apple, and two-factor authentication into clearly labeled sections, which makes the page feel structured and easy to navigate.

Buttons in Settings/Password and authentication page

The buttons stand out clearly because they use a lighter shade than the surrounding dark background. The subtle border around each button also helps separate the actions from the rest of the page without making the design feel too busy.

The image shows a dark-themed user interface for 'Sign in methods'. It features several sections: 'Email' with a 'Manage' button, 'Password' which is expanded to show 'Old password', 'New password', and 'Confirm new password' fields, and a 'Passkeys' section with an 'Add passkey' button. Below these are 'Google' and 'Apple' sign-in options, each with a 'Connect' button. At the bottom, there is a 'Two-factor authentication' section with a lock icon and a message stating 'Two-factor authentication is not enabled yet.' and a brief explanation of its purpose.

Dropdown fields after clicking Change Password

When **Change password** is selected, GitHub expands the section directly on the same page instead of sending the user somewhere completely different. The form clearly separates the **old password, new password, and confirmation** fields, while also showing the password requirements and a recovery link in case the user forgot their current password.

Asking for the old password adds an extra layer of security by confirming that the person making the change already knows the current account credentials. Requiring the new password to be entered and confirmed also helps prevent mistakes, such as accidentally saving a password with a typo.

→ When the user clicks on **“Forgot Password?”**, GitHub brings them to a page where they must enter the email address associated with their account. After the user enters their email, GitHub sends a password reset link to that verified email address instead of allowing the password to be changed immediately on the website.

This adds an extra layer of authentication because the user must prove that they have access to the email connected to the account before resetting the password. It helps prevent someone from changing another person’s password simply because they know the username or email address.

Emails

 You have a single verified email associated with your GitHub account. Add an additional verified email address in case you lose access to your primary email.

Sign In page

Additionally, GitHub makes it easy for users to log in using either their **username, email address, Google account, or Apple account**. This gives users multiple ways to access the same account without forcing them to remember only one specific login method.

On the back end, this likely means GitHub stores user account information in a database where a unique user ID is connected to fields such as the username, verified email addresses, password authentication data, and linked external sign-in providers. Rather than treating each login method as a separate account, the system can associate those different credentials with the same user record and authenticate the user based on whichever valid method they choose.
